

DID YOU KNOW?

 **EDWARDS**

The best chefs prefer cooking on gas stoves because the burners heat up much faster, they say... Today, natural gas is transported from the production site, stored at very low temperature in storage tanks and then transported to your local gas network in its liquid form, also called Liquefied Natural Gas - LNG. Edwards E2S two-stage rotary vane pumps are used for the vacuum isolation of LNG storage tanks as well as for the gas conditioning process. They make all the difference with their high pumping speed, a compact design and the possibility to have them on mobile skids. Boost the efficiency of your LNG storage with E2S vacuum pumps.

Environments where innovation thrives.
